

Cypress bypass UI login

First of all, you must install cypress local storage commands (you could use JS localStorage commands but I've used cypress one)

- Visit [Link](#)
- Follow the steps of installation and usage.

Secondly, you should request the login endpoint in order to get access to the login token.

(You can find the request in the command.js file named apiLogin)

After getting a response from the request, Locate the token from the response you've received

(`resp.body.data.userLogin.access_token` in the example)

Set that token in your local storage token, To know your local storage token name

- Login manually to your application
- Inspect after login
- Click on "Application"
- Click on "Local Storage"
- Click on your website's URL
- Check it's name under the Key Column

Set it using

```
cy.setLocalStorage('token', resp.body.data.userLogin.access_token)
```

Before running your test you have to

- Run the Apilogin command in order to set the token received from the request.
- Save your current local storage
- Restore your local storage before each test.
